Here is the discussion forum for this part of the course. Please either post your comments/observations/questions or share your creations.

Let us suggest some topics of discussion and optional projects:

SUGGESTED TOPICS

- What other examples would need tracks to be created on the fly?

- What tools can you find on the Web, for synchronizing a video with a document's content? Are these tools really easier to use than programming a simple sync by hand using the techniques presented in the course?

OPTIONAL PROJECTS

- Make an interactive page that will display information related to the video that is playing. We showed a simple example with Wikipedia pages and a Google map, but you can do better than that! Look at this funny demo that re-creates the "Indiana Jones" flight animation (a transparent Google map on top of a video). Be creative :-)

- Make something fun with the audio sprites! A small graphic animation with sound effects? A concerto with cats and dogs?
